Professional Summary

Lead Software Engineer who built GovQuest 2.0 from the ground up: a CJIS-aligned, multi-tenant public records platform on AWS, architected to scale from small agencies through state-level deployments and now used by 50+ government organizations. Leads a team of 4 engineers and drives architecture, delivery, and compliance across the platform.

Key Skills

Languages: TypeScript, JavaScript, Go, SQL

Frameworks & Data: Node.js, Next.js, React, MySQL, Redis

Cloud & Tools: AWS (ECS, EC2, RDS, S3, SQS, EventBridge, Lambda, Cognito, CloudFront, CloudFormation), Docker, Stripe, CI/CD

Practices: Multi-tenant SaaS, Event-Driven Architecture, REST APIs, Agile/Scrum, AI-Assisted Development (Claude Code, Codex, Copilot)

Professional Experience

Lead Software Engineer | Police Records and Information Management Group (PRI) | Jan 2024 – Present

- Led the architecture and launch of GovQuest 2.0, a cloud-native multi-tenant SaaS on AWS built to CJIS security standards, replacing a legacy product limited to small agencies with a flat, single-tier user model. The platform now serves 50+ government organizations and opens mid-market, enterprise, and state-level segments the company previously could not sell to.
- Built an event-driven service in TypeScript on AWS EventBridge, SQS, and ECS with dead-letter queues, providing at-least-once delivery and automated failure recovery for async workflows across the platform.
- Architected GovQuest's Stripe payment system end-to-end: subscription tiers, per-request billing, refunds, event-driven payment state handling, dynamic fee calculations, and automated invoicing.
- Delivered enterprise authentication and security aligned with CJIS requirements: Azure AD / Entra ID SSO, MFA, Cognito session hardening, domain restrictions, and role-based access control.
- Built Department, Department Groups, and Task Management modules to model complex organizational hierarchies, a capability the legacy system could not support.
- Designed a configurable workflow automation engine with routing logic, assignment pools, and request orchestration. Replaces manual handoffs across thousands of public records requests processed monthly, giving agency staff a structured queue and helping organizations meet statutory response deadlines.
- Lead a team of 4 engineers through architecture reviews, technical planning, code reviews, and mentorship, and partner with product and leadership on roadmap and compliance alignment.

Software Engineer | Police Records and Information Management Group (PRI) | May 2022 – Jan 2024

- Took ownership of the legacy GovQuest codebase as the primary internal engineer after development was brought in-house from an outsourced vendor, handling maintenance, feature delivery, and platform stabilization.
- Migrated file storage from AWS Block Storage to S3, reducing storage costs by 77% and improving retrieval performance by 40%.
- Rebuilt the legacy GovQuest payment integration with Stripe SDK and PHP CodeIgniter, hardening transaction reliability and aligning with current compliance standards.
- Standardized development and deployment environments with Docker, cutting onboarding time by ~50% and improving CI/CD consistency.
- Designed core multi-tenant MySQL schemas powering GovQuest 2.0, turning complex domain requirements into clean relational models with strong tenant isolation.

Education

A.S. Information Technology / Software Engineering, New England Institute of Technology, East Greenwich, RI
